Why do humans seek “more”?

BRAIN × MONEY

Even while attached to one partner, people may feel attracted to another. This trait is not limited to romance. Humans combine a desire to preserve what they have with a drive to seek new rewards: “There may be something better.”

This brain also operates in markets

Romance → a new partner
Purchasing → a new product
Investing → a new stock

“Satisfied” and “wanting” can coexist

CONSUMPTION

You have a smartphone that still works, yet want the latest model. The same applies to clothes, cars, watches and services.

Stimuli companies use

New products / limited editions / model changes
Limited-time offers / sales / rankings

Companies do not sell products solely on necessity. They also turn the desire to explore “something better than now” into demand.
Being satisfied does not mean desire disappears.

Desire creates economic circulation

ECONOMY

Want something better
↓
Consumption arises
↓
Becomes corporate sales
↓
Companies compete
↓
Research and technological innovation advance
↓
Further new demand emerges

The human desire for “something better” is one driver not only of consumption, but also of competition and innovation.

The stock market’s illusion: “new = value”

INVESTING

Even if you own excellent stocks, seeing another stock surge can make you want to switch. AI, semiconductors, space, robots, new drugs… new temptations constantly appear in markets.

However

A new company does not equal a good investment.
A boring company does not equal a bad investment.

Questions investors should ask themselves

“Is the business truly valuable?”
Or “Does it just look attractive because it is new?”

Desire drives the economy. In investing, consider that desire separately from corporate value.
