What is dots?

AI that keeps work moving beyond the conversation | 2026.10.23 / dots GUIDE

An always-on agent

dots is an OpenAI AI agent for entrusting ongoing work. Powered by GPT-6 Astra, it works using a dedicated cloud computer and browser.

What changes?

Share a goal and the information it needs, and it tracks progress and considers the next task. It continues working between conversations and tells the user about results and matters requiring a decision.

The cloud and your PC

Cloud work can continue even when your own device is switched off. Handling files on your PC requires a separate connection: keep the PC online and the ChatGPT app open.

From “answering questions” to “entrusting ongoing work.”

Capabilities and different roles

Research, organize, create and follow up | 2026.10.23 / dots GUIDE

Main uses

Information gathering, data analysis, document creation, software development and more. Available information and actions depend on connected apps and granted permissions.

Relationship with Chat, Work and Codex

Chat suits dialogue and explanation; Work suits research, file creation and similar tasks; Codex suits writing, modifying and verifying code. dots follows ongoing responsibilities and delegates work to Work or Codex as needed.

Example: managing article updates

Compare published articles with new information and identify areas needing changes. A possible workflow is to prepare proposed revisions and draft materials, then have a person review and publish them. This is an operational example that assumes the necessary connections and settings.

Its strength is connecting multiple tasks to an ongoing goal.

Eligibility and getting started

Begin with one responsibility | 2026.10.23 / dots GUIDE

Eligible accounts

As checked on October 23, 2026, rollout is gradual. Official guidance names Pro 100, 200 and 500, Business Premium and Enterprise. Conditions depend on age, region and administrator settings; eligibility does not guarantee immediate availability.

Creation and connections

Create it in the ChatGPT mobile app, desktop app or a PC browser. Set a name and appearance, then connect the necessary plugins. Smartphone web browsers are unsupported. Connecting your own PC is optional.

Check usage

Conversations with a dot and tasks delegated to Work or Codex are treated differently for usage allowances. Delegated tasks count toward each product’s usage limits: “always on” does not mean all work is unlimited. Check the terms on the subscription screen.

Eligibility changes; check the latest eligible plans and usage allowances before subscribing.

Delegation and oversight

Define deliverables, scope and reporting conditions | 2026.10.23 / dots GUIDE

Four things to communicate

State the purpose, reference information, finished deliverable and situations requiring your decision. Start with a small responsibility and give feedback after reviewing the result.

Example request

“Check the specified official announcements and list possible updates to existing articles. Include reasons for changes and proposed revisions, and report every Monday at 9 a.m. Japan time. Proceed with publication after review.” Specifying the scope and period also makes management easier.

Review and stopping

Permissions and automatic review apply; some actions require approval or direct user action. People should check important results. Check pausing, stopping delegated tasks and disabling recurring runs separately; stopping does not undo changes already made.

Measure the benefit by “work time saved” and “effort needed to review.”
