What is GPT-6 Astra?

An AI model supporting complex work | 2026.10.23 / Science & Technology

01 From reasoning to finished work

Astra is an OpenAI AI model. It is designed for complex reasoning, research, programming, document creation and similar tasks.

02 Working with tools

It can combine search, file processing, code execution and browser operations to advance work with multiple steps.

03 Distinguish model from service

Astra is the model that performs processing. The functions actually available depend on the service, connected tools and permissions.
Specify not only what to think about, but what to complete.

What work can it do?

Research, compare, create | 2026.10.23 / Science & Technology

01 Research and comparison

Organize issues from multiple sources and identify similarities, differences and unverified points. Also check when information applies and consult primary sources.

02 Tables and documents

Organize data into tables and charts and create explanatory text and materials. Calculations and PDF output require compatible tools.

03 Software development

Supports writing and modifying code, testing and review. Reads the existing structure and helps verify behavior after changes.
These are examples of work that can be delegated. Verify the correctness of results separately.

Astra and dots: the difference

A model and an agent that works continuously | 2026.10.23

01 Astra is the model: the “brain”

It reads text and materials, reasons and chooses the next operation. The model name alone does not determine the functions of the environment in which it is used.

02 dots handles continuing work

According to its official description, dots uses GPT-6 Astra. It tracks progress between conversations and leads into the next task or report as circumstances require.

03 Cloud and local PC are separate

dots can continue cloud work when the local PC is off. Using content on the local PC requires a connection, the PC to be online and other conditions. Results depend on the environment and how Astra’s capabilities are used.

How to ask for useful results

Align purpose, inputs and completion criteria | 2026.10.23

01 Specify the finished form

Instead of only “research this,” specify the subject, audience and format: for example, “check official materials and organize them in four pages for beginners.”

02 Define the scope delegated

Specify sources to use, deadlines, update frequency and how publication or sending should be handled. Account access requires connection and permissions.

03 Verify important details

AI can make mistakes. Check numbers, proper names, dates, links and behavior. Verify current information through search or original sources. Availability and limits vary by plan, region, account and rollout status.
