# Outlook for Switch 2 semiconductor stocks

SWITCH 2 | Semiconductor suppliers | As of September 23, 2026

Switch 2 sales alone make it difficult to predict major chipmakers’ share prices. Main drivers are AI demand for NVIDIA and memory market conditions for Micron and SK hynix. They have connections with Nintendo, but Switch 2’s profit contribution is undisclosed.

## Components and scope of confirmation

NVIDIA / NVDA: computing chip; officially confirmed by Nintendo and NVIDIA.
Micron / MU: LPDDR5 memory; confirmed in units examined by teardown.
SK hynix / 000660: UFS storage; confirmed in teardown units.
Renesas / 6723: power-management IC; confirmed in teardown units.
ROHM / 6963: power-conversion IC; confirmed in teardown units.
MediaTek / 2454: wireless communications chip; confirmed in teardown units.

## What teardown does and does not reveal

It identifies parts in the units examined. Confirmation in some units does not mean adoption in every unit or exclusive supply. It cannot establish procurement contract values.
Order for reviewing share prices: 1. Global demand and profit forecasts; 2. Each company’s main business; 3. Expectations priced into the shares; 4. Switch 2 sales and component costs.

# Upside and downside conditions by stock

Outlook horizon: six months to one year | As of September 23, 2026

## NVIDIA / NVDA

Continued AI revenue growth and supply of next-generation products are tailwinds. Slower customer capital spending or results below market expectations are headwinds. Switch 2 supply is part of gaming; the AI business has greater influence.

## Micron / MU

Focus on selling prices, volumes and margins for LPDDR5, HBM and other products. A memory-price decline caused by supply growth is a headwind. Overall memory supply and demand matter more than Switch 2 demand.

## SK hynix / 000660

UFS adoption is confirmed by teardown. HBM and DRAM orders and prices are important for the share price. Continued AI investment helps, but watch for fiercer competition and worsening supply-demand conditions from increased production.

## Renesas / 6723 · ROHM / 6963

Their connection is power IC adoption. Share prices depend on automotive and industrial demand, inventories and profitability improvement. Strong console sales alone do not establish a large change in company-wide profit.

## MediaTek / 2454

The connection is wireless chip adoption. Focus on its core smartphone SoCs and growth in communications and AI businesses. Its console supply share is unknown.

## For Nintendo, also examine component costs

If a stronger memory market raises component prices, Nintendo faces higher costs. Review unit sales, software sales, selling prices and margins together.
